

A A heterogeneous population

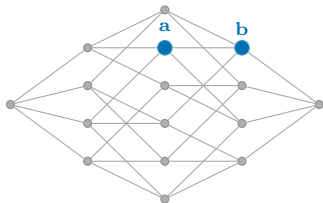

Each player i has its own payoff $\pi_i(\mathbf{a})$
state $\mathbf{a} = (C, D, C, D) \in \{C, D\}^N$

B A single transition

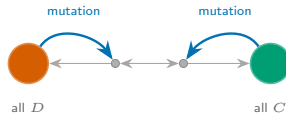

One coordinate $I(\mathbf{a}, \mathbf{b})$ flips
Weights asymmetric; self-loops included

C Each state is a vertex of $\{C, D\}^N$

Neighbours differ in a single coordinate

D Mutation makes the chain ergodic

$\text{all } C$ and $\text{all } D$ are absorbing
Mutation makes the chain ergodic
