

A A heterogeneous population

each player i has its own payoff π_i

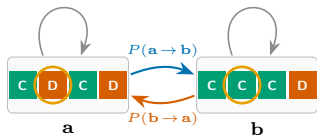

state $\mathbf{a} = (C, D, C, D) \in \{C, D\}^N$

B Each state is a vertex of $\{C, D\}^N$

neighbours differ in a single coordinate

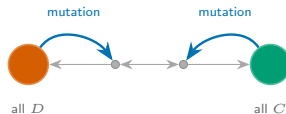

C A single transition

one coordinate $I(\mathbf{a}, \mathbf{b})$ flips

weights asymmetric; self-loops included

D Mutation makes the chain ergodic

$\text{all } C$ and $\text{all } D$ are absorbing

mutation makes the chain ergodic
